works. A jet engine works by burning fuel in air to release hot exhaust gas. But where a car engine uses the explosions of exhaust to push its pistons, a jet engine forces the gas past the blades of a windmill-like spinning wheel (a turbine), making it rotate. So, in a jet engine, exhaust gas powers a turbine—hence the name gas turbine.

The piston engine creates mechanical work, which is trans-mitted to a fan propeller , which in turn produces the re-quired thrust. The jet engine provides thrust by burning the air with fuel5 in a combustion chamber and exhausting the high-temperature mixture through a nozzle that accelerates the air.Airplanes commonly combine both types of ...

The First Jet Engine - A Short History of Early Engines. Sir Isaac Newton in the 18th century was the first to theorize that a rearward-channeled explosion could propel a machine forward at a great rate of speed. This theory was based on his third law of motion. As the hot air blasts backwards through the nozzle the plane moves forward.
