The method used to solve truss problems is to: Find the forces at the supports by using force and moment equations with given external forces. Calculate the internal forces of beams connected to a support, keeping in mind which are in compression and which are in tension.

Truss. The method of joints uses the summation of forces at a joint to solve the force in the members. It does not use the moment equilibrium equation to solve the problem. In a two dimensional set of equations,  $\sum F_x = 0$  and  $\sum F_y = 0$ . In three dimensions,  $\sum F_x = 0$ ,  $\sum F_y = 0$ , and  $\sum F_z = 0$ .

Method of Joints The free-body diagram of any joint is a concurrent force system in which the summation of moment will be of no help. Recall that only two equilibrium equations can be written  $\sum F_x = 0$  and  $\sum F_y = 0$ .

1. Make a cut to divide the truss into section, passing the cut through members where the force is needed. 2. Make the cut through three member of a truss because with three equilibrium equations viz. we can solve for a maximum of three forces. 3. Apply equilibrium conditions and solve for the desired forces.

To solve this problem by the method of sections, you pass a section (indicated by a line) through three members of the truss, one of which is the desired member. The next step is to draw a free body of one part or the other indicating all known and unknown forces. Here are the free bodies resulting from section 1-1 above.

If a truss is in equilibrium, then each of its joints must be in equilibrium. The method of joints consists of satisfying the equilibrium equations for forces acting on each joint.  $\sum F_x = 0$   $\sum F_y = 0$   
Method of Joints Recall, that the line of action of a force acting on a joint is determined by the geometry of the truss member.
